

Optimizing selectors cont.

- **Don't put all parameters in Ajax URL**

- When sending data to remote URL using an Ajax request, use data option to send them instead of putting in the URL.

```
// Don't
$.ajax({url: '/remote/url?param1=value1&param2=value2',...});
// Do
$.ajax({
  url: '/remote/url',
  data: {
    param1: 'value1',
    param2: 'value2'
  }
  ...
});
```

- In the case the parameter might be too long (the article's content, for example), consider to use the POST method for both Ajax requests and the back-end.
